

Challenges to the eradication of CRB on Guam

Roland Quitugua, Extension Biosecurity, University of Guam, USA

In 2007, *Oryctes rhinoceros* was discovered on Guam and an eradication program initiated. Traditional tools used to control and eradicate the coconut rhinoceros beetle were met with limited success on Guam requiring the development of new and improved management options. Ten years later, the fight to save the coconut tree against this destructive pest has not been lost but the door is closing and more must be done.
